Great question 👉 You're building a **Pet Rescue & Rehome Management System** as a **web application** (frontend + backend + database). Since you have **5 members**, you need to **divide responsibilities clearly** so that everyone works in parallel but smoothly integrates their work.

Here's a structured **team division**:

👥 Team Roles for 5 Members

◆ 1. Project Manager / Full-Stack Coordinator (Team Lead)

- **Role:** Oversees project, assigns tasks, ensures modules integrate.
- **Responsibilities:**
  - Define database schema (tables: pets, users, adoptions, rescues, fosters).
  - Manage Git/GitHub (version control).
  - Integrate frontend + backend.
  - Handles deployment (XAMPP/online server).

◆ 2. Frontend Developer (UI/UX Specialist)

- **Role:** Designs user-friendly interfaces for all roles.
- **Responsibilities:**
  - Build **Client & Volunteer portal** (Home, Adopt, Rescue, Contact).
  - Create **responsive UI** (HTML, CSS, JS, Bootstrap/Tailwind).
  - Ensure mobile-friendly layout.
  - Work with mockups (pet cards, forms, dashboards).

◆ 3. Backend Developer (PHP & API Developer)

- **Role:** Connects website with database and business logic.
- **Responsibilities:**
  - Develop **login/authentication system** (sessions, role-based access).
  - Build **Admin & Staff dashboard features** (CRUD for pets, users, adoptions).
  - Handle **Adoption Application Workflow** (apply, review, approve).
  - Create **Rescue & Foster management modules**.

◆ 4. Database Designer & Developer

- **Role:** Manages MySQL database.
- **Responsibilities:**
  - Design normalized schema:
    - `users` (admin, staff, volunteer, client)
    - `pets` (profile, health, foster, adoption status)
    - `applications` (adoption requests)
    - `rescue_reports`
    - `medical_records`
    - `fosters`
  - Write optimized **SQL queries & stored procedures**.
  - Ensure **data consistency, relationships, indexes**.
  - Generate reports (adoption stats, rescue trends).

◆ 5. QA Tester & Documentation Specialist

- **Role:** Ensures quality & maintains project docs.
- **Responsibilities:**
  - Test each module (forms, login, adoption flow, reports).
  - Validate role-based access (Admin vs. Client vs. Volunteer).
  - Write user manual & system documentation.
  - Collect feedback from team & suggest improvements.

📌 Work Division by Modules

Here's how tasks can be divided practically:

Module/Feature	Assigned To
UI/UX (Homepage, Pet Listings, Forms)	Frontend Dev
Login & Session Handling	Backend Dev
Admin Dashboard (Manage Pets, Users, Adoptions)	Backend Dev + Database Dev
Rescue & Foster Workflow	Backend Dev + Database Dev
Medical Records & Health Updates	Staff (Backend Dev + DB)
Reports & Analytics	Database Dev + Team Lead
Testing & Documentation	QA Tester

📅 Suggested Development Timeline (Phases)

1. **Week 1–2:** Database design + UI mockups.

2. **Week 3–4:** Implement authentication + core CRUD (pets, users).
3. **Week 5–6:** Add adoption/rescue/foster workflows.
4. **Week 7:** Reports & analytics + UI refinements.
5. **Week 8:** Testing, bug fixing, final documentation.

✅ This way, your **5 members work in parallel**:

- **Frontend** makes pages look nice.
- **Backend** makes them interactive.
- **Database** stores everything.
- **QA** ensures smooth working.
- **Team Lead** makes sure all modules connect properly.

👉 Do you want me to **draw a project module breakdown diagram (like a chart showing who handles what)** so your team can visualize responsibilities better?
